1 PROCEEDINGS 2 14:55:25 3 (Proceedings commenced in the courtroom, 14:55:45 4 beginning at 3:11 p.m.) 14:55:52 5 15:02:15 THE COURT: All right. Good afternoon, 6 15:02:15 7 everyone. Please be seated. 15:02:16 8 This is IPA Technologies, Inc. versus 15:02:17 9 Amazon.com, Civil Action No. 16-1266, and IPA Technologies 15:02:22 10 versus Sony, Civil Action No. 17-55. 15:02:27 11 Mr. Brauerman, good afternoon. 15:02:34 12 MR. BRAUERMAN: Good afternoon, Your Honor. 15:02:39 13 Steve Brauerman from Bayard on behalf of the plaintiff, IPA 15:02:40 14 Technologies, Incorporated. 15:02:45 15 I'm joined at counsel table by Marc Fenster and 15:02:46 Brian Ledahl of Russ, August & Kabat in Los Angeles, and 16 15:02:50 17 with your Honor's permission, Mr. Fenster will address the 15:02:53 18 Court today. 15:02:57 19 THE COURT: That will be fine. Mr. Fenster is 15:02:57 20 pretty well-known here. Mr. Smith or Mr. Balick, they're 15:02:59 21 pretty well-known, too. 15:03:03 22 Good afternoon, Your Honor. 15:03:04 MR. SMITH: 23 Rodger Smith from Morris Nichols on behalf of the Sony 15:03:05 defendants. 24 15:03:05 25 I am joined by Michael Hendershot from Paul 15:03:05

15:03:08	1	Hastings and his colleague David Okano, also from Paul
15:03:13	2	Hastings.
15:03:14	3	THE COURT: Okay. Thank you.
15:03:15	4	MR. SMITH: Thank you.
15:03:16	5	THE COURT: Thank you. Mr. Balick?
15:03:17	6	MR. BALICK: Hello, your Honor.
15:03:18	7	THE COURT: Good afternoon.
15:03:19	8	MR. BALICK: Good afternoon. Steven Balick from
15:03:21	9	Ashby & Geddes here on behalf of Amazon.
15:03:23	10	I'm joined by co-counsel from Fenwick & West,
15:03:25	11	David Hadden.
15:03:25	12	MR. HADDEN: Good afternoon, Your Honor.
15:03:27	13	MR. BALICK: And Rovi Ranganath. And our client
15:03:30	14	is with us as well today. Ajeet Pai from Amazon is in the
15:03:34	15	back of the courtroom.
15:03:36	16	THE COURT: Okay.
15:03:37	17	MR. BALICK: Thank you.
15:03:38	18	THE COURT: Thank you.
15:03:38	19	And let me think. I recall I think Amazon wrote
15:03:44	20	the first brief and then Sony wrote the second. Do I have
15:03:51	21	the order right?
15:03:51	22	MR. HADDEN: Yes, your Honor.
15:03:52	23	THE COURT: And so in terms of the defendants'
15:03:54	24	side of the equation here, who is arguing what?
15:03:57	25	MR. HADDEN: Sure, your Honor. David Hadden for

15:04:02	1	Amazon.
15:04:03	2	We'll go first and focus on step 1 mostly of the
15:04:05	3	Alice test and Mr. Hendershot will follow me.
15:04:13	4	THE COURT: All right. Does that mean he's
15:04:15	5	going to focus on step 2?
15:04:19	6	MR. HENDERSHOT: Yes, Your Honor. I'm not going
15:04:20	7	to retread ground covered by Mr. Hadden. I am going to
15:04:21	8	focus primarily on the positions and the specifications that
15:04:23	9	relevant to the question.
15:04:23	10	THE COURT: Okay. Go ahead, Mr. Hadden.
15:04:27	11	MR. HADDEN: Thank you, Your Honor.
15:04:35	12	So as you know, Your Honor, the three patents in
15:04:38	13	this case share common specifications, and all claim
15:04:41	14	priority to the same initial application. All of the
15:04:45	15	patents
15:04:46	16	THE COURT: Remind me. That is what date,
15:04:48	17	approximately?
15:04:48	18	MR. HADDEN: 1999, Your Honor.
15:04:50	19	THE COURT: Okay.
15:04:50	20	MR. HADDEN: And all of the patents and the
15:04:55	21	claims in this case are invalid because they claim a result,
15:04:57	22	not a specific function, or not a specific solution to
15:05:03	23	achieve that result.
15:05:03	24	THE COURT: And is this argument about the
15:05:08	25	hundreds of claims that are in here or are there, as the
	<u> </u>	

1 15:05:13 2 15:05:16 3 15:05:16 4 15:05:19 5 15:05:23 6 15:05:26 7 15:05:30 8 15:05:33 9 15:05:38 10 15:05:38 11 15:05:42 12 15:05:43 13 15:05:44 14 15:05:46 15 15:05:46 16 15:05:53 17 15:05:55 18 15:05:57 19 15:06:02 20 15:06:07 21 15:06:11 15:06:14 22 23 15:06:18 24 15:06:21 25 15:06:25

plaintiff indicated, some claims are asserted and not others?

MR. HADDEN: So the plaintiff has identified asserted claims in each of the patents, and basically claim 1 from each of the patents. There has been no, nothing in the briefing that has raised additional limitations for dependents claims, as they've been called out. So I think it's effectively undisputed that those claims are represented.

Before I go further, I do have some books here that I could hand up.

THE COURT: Yes.

MR. HADDEN: If you would like them.

THE COURT: Yes, please.

(Mr. Hadden handed slides to the Court.)

MR. HADDEN: The problem with these claims is the same problem that the Federal Circuit found with the claims in Infinity Labs, which is they do no more than describe a function or an outcome without providing any limiting detail to a particular solution to that problem.

And that is a vague issue here, because the problem is a huge one. It is sort of one of the holy grails of computer science, which is understanding and responding to spoken natural language. That is something that has been intense study of computer scientists for decades, both in industry

and academia, and it has begun to bear fruit in the last several years with very useful consumers products like Amazon's Alexa and Apple's Siri that now allow millions of people to get information and entertainment by asking for it.

But there's nothing in these claims that describe a particular way for that to work. There is no new natural language processing technology claimed. There is no new speech recognition technology claimed. All the patents claim is the idea itself that such an interaction would be useful, and that's not enough.

As the Federal Circuit told us repeatedly up until two weeks ago in the Two-Way Media case, that as a 101 analysis, we have to focus on the claims to see whether they're actually directed to a specific solution or just a result, which is nothing but the idea itself, which is the case here. And the Federal Circuit in Two-Way Media found the same thing that we asked here. Result-based functional claim language, that it does not sufficiently describe how to achieve the results in a non-abstract way.

And the Federal Circuit reminded us that the focus has to be on the claims themselves. The claims themselves have to include that required specific technical solution, and the claims here don't. All right.

The idea, or the recognition that it would be

1 15:06:30 2 15:06:34 3 15:06:37 4 15:06:42 5 15:06:46 6 15:06:46 7 15:06:49 8 15:06:53 9 15:06:56 10 15:07:02 11 15:07:05 12 15:07:07 13 15:07:11 14 15:07:18 15 15:07:20 16 15:07:23 17 15:07:28 18 15:07:31 19 15:07:35 20 15:07:39 21 15:07:42 15:07:45 22

cool to get information by talking to a computer, or to get the movie you want by asking your remote, all of these patents claim. And there's an example in the patent, this video on demand application.

THE COURT: Oh, yes. Clint Eastwood.

MR. HADDEN: Right. When the user wants to see a Clint Eastwood movie, he wants to see Unforgiven, but doesn't remember the name, so he asks for movies that are directed and starring Clint Eastwood.

And the way the patent explains that it works is, you say, I want to see that movie storing and directed by Clint Eastwood. I don't remember the title. You talk into your remote control, and somehow you get back a list of movies that are starring and directed by Clint Eastwood. Unforgiven, True Crime. It's an old patent. It doesn't have Million Dollar Baby and several others. But there's no description of how these results are obtained. There is no description of how what you've said is understood by the computer system, and there is no description of how an appropriate data source is somehow queried to find the results.

The next step in the idea here is that you get back a list of movies, and then you can pick Unforgiven from that list by clicking 1 on your remote control. is the multimodal input that we heard much about in IPA's

But just picking from a list after you have gotten a subset of what you ask for, that is just an abstract idea. That is not technology. There's no description in these claims of any piece that would give you any part of this interaction. The claim is just the idea of the interaction itself.

And if we look at the claims, that is clear. So here's claim 1 from the '021 patent, which is one of the asserted claims.

The preamble just talked about speech-based navigation using network servers. Clearly, having network servers is nothing innovative or original.

The first element is just receiving the request. I want to see a Clint Eastwood movie.

In response to that, the next step is rendering an interpretation of the spoken request. And this is where the real land grab is in this case. Right? That is the very hard problem that people have been trying to solve for decades and this claims the result. You render the interpretation. You determine the meaning. There is no explanation here --

THE COURT: But I thought that by the time this was written, there were already commercial programs that could render interpretation of the spoken request.

15:12:02	25

why there's no further description of this that's probably necessary.

MR. HADDEN: Well, there was certainly voice recognition software and there were some programs that would interpret the natural language to words that came out of that. But doing that in a way that is actually useful, like with Amazon's Alexa or Apple's Siri, it was a very hard problem.

THE COURT: Well, right, but they're not actually -- the patent is not actually claiming Alexa. It is claiming something else.

MR. HADDEN: Well, they have sued Amazon based on Alexa.

THE COURT: Well, no. I'm not saying they don't say Alexa reads on it.

MR. HADDEN: Sure.

THE COURT: But they're not -- and so maybe that's inconsistent. But I mean as I understand it, they're saying the improvement here has nothing to do with, at least the first two steps.

MR. HADDEN: I agree completely, Your Honor, that there is nothing in the patent that provides an improvement to the way that a computer would understand spoken language. The problem I have is that they have a claim that says, understands spoken language, and they're

1 15:12:06 2 15:12:10 3 15:12:13 4 15:12:15 5 15:12:21 6 15:12:25 7 15:12:29 8 15:12:33 9 15:12:34 10 15:12:36 11 15:12:41 12 15:12:46 13 15:12:49 14 15:12:51 15 15:12:54 16 15:12:58 17 15:13:01 18 15:13:01 19 15:13:06 20 15:13:10 21 15:13:14 15:13:17 22 23 15:13:21 24 15:13:24 25

15:13:28

trying to apply it to any system that does that without having provided a better or improved way to do it.

THE COURT: Well, it seems like the question of whether they do or they don't, that's in the five terms or five limitations that follow; right? And I understand your position is that they don't, but I think that's where you need, where we need to concentrate.

Do you agree?

MR. HADDEN: Well, I agree in part, Your Honor. I agree that we need to look at the next five terms, but all of those five terms use what is the output of step 1. The meaning of what was spoken. Right. Right.

So they're not saying there's any better way here of understanding what was said. You just understand what was said. Right. And then you do some other things, like provide the list of movies, and we can walk through those.

So in essence, every one of these claims is a subset of every way to determine what was said, and that is a huge grab where there's no technology for doing that that's described or claimed.

So if we look and see what actually else happens here, right, the next step is just constructing this navigation query based on the interpretation. So that's just somehow creating a query that is going to get me

1 15:13:32 2 15:13:37 3 15:13:40 4 15:13:42 5 15:13:48 6 15:13:51 7 15:13:53 8 15:13:58 9 15:14:01 10 15:14:06 11 15:14:10 12 15:14:14 13 15:14:19 14 15:14:21 15 15:14:26 16 15:14:30 17 15:14:33 18 15:14:37 19 15:14:41 20 15:14:45 21 15:14:48 22 15:14:50 23 15:14:54 24 15:14:56

25

15:15:00

Unforgiven, Absolute Power, I forgot what the third Clint
Eastwood movie is, but whatever it is that I asked for in my
original question. All right. And there's no description
here of how you construct that query, how you take the
meaning of what was said and turn it into some sort of query
or some sort of data search.

And then the next step is the listing of the three options. Right. It's the listing additional input from the user. But there's no description here of determining when additional input would be required. Right. There's no way of determining in this claim what initial spoken request was ambiguous or needed clarification.

There's no description of doing that or how you would do that here. All this says is you provide some options that someone can respond to with no way of figuring out what those options would be or why you would need them.

And then the next step is just using whatever additional information you got from the user to somehow come up with a query that is more tailored to what they want, but there's no way, there's no description of how you would do that.

And, finally, there's just using this query that you get at the end of the day and get whatever it is the user wants from any electronic data source, and you transmit it back to them.

1 15:15:02 2 15:15:06 3 15:15:09 4 15:15:13 5 15:15:17 6 15:15:19 7 15:15:23 8 15:15:26 9 15:15:31 10 15:15:34 11 15:15:37 12 15:15:48 13 15:15:51 14 15:15:57 15 15:16:02 16 15:16:03 17 15:16:06 18 15:16:10 19 15:16:12 20 15:16:15 21 15:16:21 15:16:26 22 23 15:16:30 24 15:16:33 25 15:16:36

So at the end, all this claim does is describe the steps we saw in the Clint Eastwood example, with no description of any technology for actually making any of that transaction work. It's just the idea of the transaction itself.

And if we look at the proposed claim constructions that IPA provided in response to Your Honor's request, it's clear that they don't provide any more of a concrete solution to the claim. All right.

THE COURT: Well, I didn't think they really caused much narrowing or something else that -- you know, sometimes you do this to see whether there's some sort of generic term that the claim construction is more specific, so I didn't think the claim construction, at least it wasn't obvious to me that it made any difference.

MR. HADDEN: I think, in fact, Your Honor, the claim construction designated is more result and function oriented than the claim itself. All right.

So electronic data source is basically any sorts of digital information. Rendering an interpretation of the spoken request is again any means existing or in the future for determining the meaning of a spoken request using a computer. That's the big hard problem that people are working hard to do better and better every day.

And then navigation query is basically anything

1 15:16:40 2 15:16:44 3 15:16:50 4 15:16:51 5 15:16:53 6 15:16:56 7 15:17:00 8 15:17:05 9 15:17:08 10 15:17:13 11 15:17:16 12 15:17:22 13 15:17:25 14 15:17:29 15 15:17:31 16 15:17:35 17 15:17:39 18 15:17:44 19 15:17:47 20 15:17:52 21 15:17:53 15:17:57 22 23 15:18:00

24

25

15:18:03

15:18:07

that is appropriate to search the desired information. I mean, that is just the final result. Right? Whatever information to get you the information you want is a navigation query under the construction.

So I think, if anything, the constructions just show that this is a purely result oriented functional claim that basically covers any interactions with a computer that will get you the information you want with some step in between where you clarify in some undetermined manner.

Now, if we look at, you know, where is the real required specific technical solution, well, IPA has pointed us to one in their brief. They say, the asserted claims are directed to technological solutions specific to navigating electronic data sources. But we just saw, their construction of electronic data sources is any sort of digital information. That is not a specific field to start with. And what's required is not applying the abstract idea to some specific field of use. What is required is a specific technical solution that would get you the result, and that's not here.

They talk about the use of structured navigation queries, but, again, their own construction of that is anything that will get you the information you want from any electronic source. That is not a technical solution.

That's a result. A black box.

1 15:18:08 2 15:18:11 3 15:18:14 4 15:18:18 5 15:18:22 6 15:18:26 7 15:18:30 8 15:18:33 9 15:18:36 10 15:18:40 11 15:18:43 12 15:18:46 13 15:18:50 14 15:18:54 15 15:18:56 16 15:19:02 17 15:19:06 18 15:19:08 19 15:19:13 20 15:19:16 21 15:19:19 15:19:22 22 23 15:19:26

24

25

15:19:31

15:19:33

They talk about quickly and efficiently
navigating increasingly large and complex electronic
databases, but there's nothing in that claim that we saw
that does anything to help you navigate a large complex
database. Right. Sure, asking for something and getting it
back out of a complex database would be a great thing, but
there's no solution in that claim for doing it.

And, finally, they talk about resolving errors and ambiguities and it's the same issue. Yes, it's great to have a system that resolves the errors and ambiguities, but there's nothing in the claim that even identifies an ambiguity or provides a way to resolve it. Right. All they say is, the user can provide more information, but that doesn't tell you how to do anything.

At the end of the day, the claim as basically illustrated in the specification is a series of black boxes and they're all in it. Right. You have some speech recognition. You have some natural language parser, and then you have a way to construct queries and refine them. But these boxes are completely empty in the claim. There is no technology for doing any of these. They're just results.

Now, they tried to, you know, wrap themselves in Enfish and some of the other Federal Circuit cases that have held claims, but those claims had a specific solution.

1 15:19:38 2 15:19:42 3 15:19:46 4 15:19:53 5 15:19:54 6 15:19:56 7 15:20:01 8 15:20:03 15:20:09 9 10 15:20:13 11 15:20:16 12 15:20:18 13 15:20:21 14 15:20:25 15 15:20:27 16 15:20:30 17 15:20:36 18 15:20:42 19 15:20:46 20 15:20:51 21 15:20:53 15:20:54 22 23 15:20:57 24 15:21:00 25 15:21:04

Right. Enfish you have the self-referential database and the four-step limit. Bascom, you had a new approach to using the IP address to custom filter Internet content in an ISP.

There's nothing comparable to those solutions in these claims. It is just, ask for what you want from a computer, provide some followup, and get it.

And there's a lot of, you know, claiming that somehow this is the technology that enabled Siri and the timeline couldn't be clearer that that is nonsense. This patent was filed in 1999.

The folks who invented Siri as well as hundreds of artificial intelligence researchers who worked on the CALO project --

THE COURT: What you are talking about now, which, you know, I did see some back and forth in the brief, given the procedural posture of this case, it may be well-known to you all, some of this stuff, but it's not well-known to me.

Shouldn't I just ignore this part in terms of what I have to do here?

MR. HADDEN: I don't think you have to, Your

Honor, in fact, because it's in their pleading. They plead

the release dates of Siri. We know the filing date. If you

want to skip the CALO in between, they acknowledge those

1 15:21:07 2 15:21:11 3 15:21:12 4 15:21:14 5 15:21:18 6 15:21:23 7 15:21:27 8 15:21:31 9 15:21:35 10 15:21:38 11 15:21:41 12 15:21:48 13 15:21:52 14 15:21:55 15 15:22:00 16 15:22:03 17 15:22:07 18 15:22:11 19 15:22:17 20 15:22:21 21 15:22:26 15:22:29 22 23 15:22:33 24 15:22:38

25

15:22:40

dates are correct in their opposition to Sony's brief.

There's no real dispute.

But I think the point is clear that the problem with this patent and patents like it is, they're trying to claim the decade of innovation that led to the actual product. Right. And there's a corresponding decade of innovation by Amazon that led to Alexa and Google that led to Google Voice. And you can't jump to the finish line and grab the results of that innovation and real invention based on this empty patent from '99.

THE COURT: So what you are just saying now, if the case goes forward, is that some combination of a written description or enablement defense?

MR. HADDEN: Well, I think there is definitely both a written description and enablement issue, but the issue I'm going at more is the preemption issue. Right. That underlying rationale or one of them under 101 is that you don't get a claim that you solved a problem and then claim everybody else's future solutions. All right. I mean, it's like Judge Bryson said in Affinity Labs. Right. You can't just write down a problem, check I solved it, and then preempt all the development that goes into real solution, which is what they're doing here. Right.

We saw the claim. There's no claim that a specific way to do anything exists. People spend decades

and hundreds of millions of dollars developing ways that actually work well, and these folks are trying to claim them.

THE COURT: And I'm sorry. The case you were citing with Judge Bryson --

MR. HADDEN: Affinity Labs versus Amazon, Your Honor.

THE COURT: Was that a District Court or -
MR. HADDEN: He said essentially the same thing
in a prior District Court opinion, but that is a Federal
Circuit opinion, Your Honor.

THE COURT: Okay. All right.

MR. HADDEN: And that's the problem with these types of patents, and I think that's the clearest kind of 101 issue, which is that the difference between claiming a technical solution, which you have a right to, and just claiming a problem and the notion that you could solve it, which is all we have here.

They tried to distinguish cases like Affinity

Labs versus Amazon and there's just no way to do it. So

this is the representative claim from that case. It is like

the claim here in that it is aspirational. Right. It is

basically claiming the idea that it would be cool to

download music or video to my wireless device without

providing any real technology for doing it. But it

certainly provides the level of kind of description that's in the claims here or more. It talks about streaming video using some network based resources and a list of network locations. That is more specific than the claims here, which talk about getting any type of information from any digital source in any manner.

THE COURT: Was Affinity Labs -- I have to say notwithstanding the fact that I try to read these cases, not one that I can draw any picture of. Was that a motion to dismiss or a summary judgment?

MR. HADDEN: It was a motion to dismiss. I actually argued this one. It was a motion to dismiss, Your Honor.

THE COURT: Okay. Right. All right.

MR. HADDEN: And the other case that I think is just, there's not a universe where the Electric Power Group claim is invalid and this claim is valid. Right.

Electric Power Group, the claim has a lot of detail in describing what data is received, specific time limits on it, how it is analyzed, how it is compiled and accumulated, and how it is used to develop these indicators of reliability. If this claim is fatally abstract, I don't see how the claims in these IPA patents could possibly survive.

One last point, Your Honor. In a footnote in

IPA's opposition, they point to the word "agents" in some of the claims of the '061 patent as being relevant. I think tellingly, Your Honor, IPA did not provide a construction for agent, and did not include it on the list of terms that were somehow relevant to this motion, so I don't think it is.

If you look at how it's actually used in the claim, it's just another name for the black box that performs some of these functions, like utilizing the navigation query to select electronic data. It doesn't tell you anything about what the agent does to make that happen. And, in fact, in the patent that is incorporated by reference, it talks about agent, there's no dispute that there's not something that IPA invented. Right. It talks about agent as being a known prior art way of creating distributed software. It's like object oriented programming on steroids.

THE COURT: All right. You're using words that don't necessarily mean anything to me.

MR. HADDEN: Sorry, Your Honor.

THE COURT: Can you --

MR. HADDEN: Yes.

THE COURT: -- explain this --

MR. HADDEN: My only point, Your Honor -- my only point.

If we go back to the claim, sorry, they have some claims that talk about agents during X, Y and Z. They don't tell you anything about how the agents do it, so all this is just another name for some black box that performs this function and achieves whatever this result is. Querying the data source, for example.

THE COURT: And just on a basic level, you think agents, you would interpret it as being things, not people?

MR. HADDEN: Right. So there is a kind of software development paradigm in which things called agents are used. They are basically little programs that can coordinate with each other to perform tasks.

THE COURT: All right.

MR. HADDEN: But the basic idea of agents is not an invention, and they acknowledge it's not.

THE COURT: And so in a different context not too long ago, people were talking about macro. Is that the same idea?

MR. HADDEN: Not exactly, but an agent is kind of like -- it is, the patent actually describes it as a wrapper around an application, so you have some program that does something, and then you want it to be able to work with another program that does something else to try to solve basically a bigger problem. To do that, you can provide

some additional capabilities tha	15:28:30 1
different programs to exchange i	15:28:34 2

15:31:16

15:31:19

few items Your Honor was discussing with co-counsel.

Specifically with regard to agent, if you could pull up slide 16, or slide 11, please.

There was some discussion about what software agents were and it is generally accurate. The specification talks about them by reference to establish technology and what was commonly known at the time.

I think what you primarily need to know about agents in connection with this motion are two things. One, they didn't offer construction of them suggesting that they would be anything other than a direct software concept.

And, two, in their opposition, IPA's opposition to Sony's notion, they noted that Sony said certain claim elements such as agents and facilitators, which are also in the '061 claims, were known or conventional.

And then IP explains, the patents do not claim that these elements are inventive, nor do they claim to improve upon the OAA, which I may touch upon, which was a software application that was known and available that used both agents and facilitators.

So there's no argument I'm hearing from the other side that those are transformative or inventive.

With respect to Your Honor's question about Siri, and there's discussion about subsequent development. From the date of the application for these patents, there

1 15:31:23 2 15:31:27 3 15:31:31 4 15:31:36 5 15:31:41 6 15:31:45 7 15:31:51 8 15:31:53 9 15:31:58 10 15:31:59 11 15:32:03 12 15:32:06 13 15:32:09 14 15:32:14 15 15:32:17 16 15:32:19 17 15:32:22 18 15:32:26 19 15:32:29 20 15:32:32 21 15:32:36 15:32:39 22 23 15:32:40

24

25

15:32:43

15:32:45

absolutely was a decade, probably coming up on two decades now of R&D and research and innovation to develop a robust commercial product that a consumer can use reliably, dual voice assistant, Siri, Alexa, the things some of us use today, but at the level these functions are claimed, transmitting of information, interpreting. In 1999, those ideas were established. Those were conventional. It was a robust field of art that the specification itself points to about what was known.

So the idea, the idea of performing the functions at the level they're recited in these claims may have taken additional time to develop a really successful commercial product, but at the level they're claimed was absolutely known and established conventional at the time of the invention.

And Your Honor raised a question about representative claims. I can touch on that briefly. Both Amazon and Sony identified what they believed were representative claims in their motion. They matched up to the claims identified in the complaints and opposition. I don't think representativeness was contested.

There are a number of claims in one of the patents, but I don't think really could argue that they're not fairly represented by the claims we've briefed.

THE COURT: And which do you -- wait a second.

15:32:52

Yes, okay. Never mind.

2 15:32:54 3 15:32:59 4 15:33:03 5 15:33:06 6 15:33:10 7 15:33:13 8 15:33:18 9 15:33:21 10 15:33:23 11 15:33:25

MR. HENDERSHOT: Just a few examples. The '021 patent has six sets of independent claims, substantially identical dependent claims. So there are a series of repeating claims. There are six dedicated to using a database language. There are six dedicated to processing locally. Six dedicated to processing remotely. 16, to display items on a menu when selecting them. I don't think there's a fair argument that the claims we've identified aren't representative and I don't think they've raised one in their briefing.

So I don't want to retread ground that co-counsel covered -- slide 2, please. I want to touch, I think the claims control. That's clear from the Federal Circuit.

I think it's clear if you look at the claims in these patents, they fall right in line with Electric Power Group, TLI, the Affinity case and the Two-Way Media case, and that they claim desired results without any way of achieving those.

The specification I think confirms that and gives some reason as to why they're probably claiming them at such a high functional level. This is a sentence on the slide here from IPA's opposition. It says, The patents address these needs by providing essentially navigating

1 15:34:12 2 15:34:16 3 15:34:20 4 15:34:23 5 15:34:25 6 15:34:28 7 15:34:32 8 15:34:36 9 15:34:39 10 15:34:43 11 15:34:44 12 15:34:48 13 15:34:52 14 15:34:54 15 15:34:58 16 15:34:59 17 15:34:59 18 15:35:01 19 15:35:04 20 15:35:07 21 15:35:10 15:35:11 22 23 15:35:13 24 15:35:21 25 15:35:24

network based electronic data sources in response to spoken input requests, and the needs that were identified ahead of that included finding, developing a voice driven front end to existing data back ends.

Now, that stuck out to me -- go to the next slide. Because the specification I believe Your Honor was alluding to earlier provides on the voice front end side, there were readily available commercial quality speech recognition engines. They don't claim to have improved that or modified those.

With respect to the back end, the patent is very clear that practitioners of ordinary skill in the art would have been thoroughly familiar with the notion of database navigation through structured query, which is the concept of constructing the database navigation theory that turns up in the claim.

So on the front end, there's commercially available stuff, and on the back end, persons of skill in the art would be thoroughly familiar with the technology. And those two concepts in several admissions bear out through all the claims.

If we go to the next slide, please.

So this is the '718 patent, a method very similar to the '021 claim that counsel talked about.

There is a wherein clause in element A that says

1 15:35:29 2 15:35:33 3 15:35:34 4 15:35:37 5 15:35:41 6 15:35:44 7 15:35:47 8 15:35:50 9 15:35:53 10 15:35:56 11 15:36:00 12 15:36:04 13 15:36:09 14 15:36:11 15 15:36:12 16 15:36:15 17 15:36:16

15:36:39

15:36:45

the appliance is a formal remote control device or a set top box for a television.

The specification doesn't offer any particular solution or identify any problem that arises from that context. That's just a limitation to a technical field, which Alice in subsequent cases has made clear isn't sufficient to take an abstract idea and transport it to something patent eligible.

If you look at slide 5, it's a passage from the specification. It just identifies a set top box, and this television environment as one of any number of different hardware and software computing platforms on which you could implement the invention. It says you can do it on this platform. It doesn't offer any particular technical solution or identify any particular technical problems arising in that space.

We've cited in Sony's briefing cases that have held a set top box and a remote control aren't sufficient to transform similar claims into patent eligible subject matter, and we think the '718 is no different.

Go to the next slide.

This is the '021 patent, claim 1, which was discussed. This is similar to the '718 we just spoke about, except it adds this non-spoken modality and multi-modality input. I will admit when I read that, it struck me as

29

pretty fancy language. And I thought, there might be something there multi-modality, non-spoken input.

Any time you're interacting with a computer, you are engaging in multi-modality input. If you use a keyboard and a mouse, those are two forms of -- two modalities of input in the terms of the patent.

If you ever had to try to make a reservation on I think United way back in the day, where you get a voice menu and you would speak or hit a number, that's multi-modal input. Multi-modal input is the most common way to interact with an electronic device. It's frankly so ubiquitous, I had taken it for granted when I first read the language.

If you look at the specification on the next slide, I think it makes really clear that this multi-modal input is not transformative, it's not inventive. The non-spoken input the patent contemplates is either a menu selection or simply pressing an okay button in response to a return of, results from a spoken search. That is among the most conventional ways to interact with the device, and the idea that including that in connection with a spoken input device renders it unconventional I think is just contrary to the specification and some additional admissions it makes.

The next slide, please.

So the specification acknowledges there was a

1 15:36:49 2 15:36:53 3 15:36:58 4 15:37:01 5 15:37:03 6 15:37:06 7 15:37:07 8 15:37:09 9 15:37:12 10 15:37:16 11 15:37:20 12 15:37:25 13 15:37:28 14 15:37:30 15 15:37:34 16 15:37:37 17 15:37:41 18 15:37:45 19 15:37:49 20 15:37:52 21 15:37:55 15:37:59 22 23 15:38:03 24 15:38:03 25 15:38:07

15:39:24

15:39:27

prior art open agent architecture system, or OAA. That was a known system that was subject to a number of publications well before the earliest priority date for these patents.

The patent acknowledges that the OAA was known to provide a useful software platform for building systems that integrate the spoken natural language as well as other user modalities.

So the specification is acknowledging that this prior art system that's covered in a number of publications and was known was useful for using multiple modalities.

And then in IPA's opposition, which is the second quote, they acknowledge the patents do not claim that these elements are inventive, the elements from the list earlier, nor do the patents claim to invent or improve upon the OAA. You have an existing conventional software platform that enables you to use natural language and other modes of input, and their brief acknowledges they don't claim to have invented it or improved upon it in here.

Again, they are making use of conventional and established technology to implement these high level functions.

Go to the next slide.

The '061 patent. It is similar to the '718 and '021 except it doesn't have the multimodal input, it doesn't have the television set top box or remote control. It has

1 15:39:33 2 15:39:36 3 15:39:38 4 15:39:41 5 15:39:45 6 15:39:49 7 15:39:52 8 15:39:54 9 15:39:58 10 15:40:01 11 15:40:04 12 15:40:08 13 15:40:12 14 15:40:16 15 15:40:19 16 15:40:23 17 15:40:25 18 15:40:27 19 15:40:30 20 15:40:32 21 15:40:35 15:40:38 22 23 15:40:43 24 15:40:44

25

15:40:48

what we've talked about with agents and facilitators.

Can we go to the next slide.

The specification acknowledges in the first quote there that this OAA system, which was publicly known, covered a number of publications, included the agents, the facilitators, everything that was claimed there for those terms we talked about a moment ago.

The specification acknowledges OAA was known as a useful software platform for natural software applications, and it points out a number of prior examples, including the Info Whiz, a unified messaging system and a CommandTalk application. And this CommandTalk application combine natural language input, non-spoken modalities, agents and facilitators, all in a system where you could respond to a spoken input. That was from well before the priority date for these patents that was incorporated into the specification, and it's attached as Exhibit A to our motion.

That CommandTalk system demonstrates this order combination and each of these elements they're talking about and trying to claim at a functional level were known, established and conventional.

Go to the next slide.

And we touched on this earlier. With respect to agents and facilitators, their brief acknowledged they don't

32

contend that they are inventive.

I agree with what counsel said about the claim constructions and understand Your Honor's view of them. I agree with it. I don't think they added much to render them anything other than claiming a function or desired result.

On slide 12, 13 and 14, we've included passages from the specification that confirm these are things that were known and conventional at the time.

The navigation query, they talk about it being appropriately structured. Well, the specification says that means whatever content or structure you need, include.

That's not specific. That doesn't limit it to any technological implementation.

With respect to navigation queries, it talks about using SQL or a relationship database, and the patent acknowledges that SQL was both an ANSI and an ISO standard, so it is one of those conventional technologies.

Go to the next slide.

Electronic data source could basically be anything, a database, a website.

Go to the next slide. And rendering an interpretation of the spoken request. Again, the patent acknowledges, there are a variety of commercial quality speech recognition products on the product market, including

1 15:42:06 2 15:42:11 3 15:42:17 4 15:42:18 5 15:42:21 6 15:42:24 7 15:42:25 8 15:42:26 9 15:42:30 10 15:42:33 11 15:42:37 12 15:42:40 13 15:42:43 14 15:42:45 15 15:42:49 16 15:42:55 17 15:42:58 18 15:43:00 19 15:43:01 20 15:43:04 21 15:43:07 15:43:09 22 23 15:43:10 24 15:43:14 25

15:43:14

a low-cost shrink-wrapped version. And it says, basically a speech recognition engine processes acoustic voice data and attempts to generate a text stream of recognized words.

That basically maps to the second half of their construction. The patent again acknowledges those were commercially available and conventional.

Next slide.

And if you look at their arguments about their constructions, they appear to be arguing that really their invention that they're arguing about or contending they came up with is coming up with a voice input for a computer and that combination at that high of a level.

They point to their constructions and argue, look, we tie it to digital data. We tie it to electronic The first quote says, the improvements are specific data. to navigating electronic data sources rather than the abstract idea of using speech to obtain any kind of information.

The next quote they emphasize, the emphasis of the original, that you're doing electronic data.

And the next one says data is numerical, which means it's digital.

And the last one, they emphasize that electronic is unpacked. They emphasize the patent is a computing device. Additional data, electronic communications and

1 15:43:21 2 15:43:24 3 15:43:29 4 15:43:33 5 15:43:35 6 15:43:39 7 15:43:42 8 15:43:44 9 15:43:49 10 15:43:52 11 15:43:54 12 15:43:54 13 15:43:57 14 15:43:59 15 15:44:02 16 15:44:06 17 15:44:07 18 15:44:15 19 15:44:19 20 15:44:22 15:44:25 21 15:44:28 22 23 15:44:30 24 15:44:33

25

15:44:35

computing device are all as generic computing technology you can find. This is Alice. This is taking an abstract idea at a functional level and saying, do it on a computer.

I do think they argue that. Their position on step 2 evolved through their briefing. They initially said there were questions of fact as to whether individual elements were known or conventional. Sony submitted its brief mapping each claim element to admissions in the specification establishing that they were both known and conventional.

They came back in response to Sony's brief and said, some of the quotes you see earlier, well, even if their individual elements are known and conventional, it's really the combination. We're like Bascom. We have an combination of conventional elements.

If you pull up the '718, claim 1. The order in which they are claiming these functions is as conventional as you can get. There's really not another way to process a spoken request outside of this ordered combination here. You receive an input. You interpret it. You search for information based on the interpretation and you return the information that was found based on that search. There is not another way to sequence that and have a functioning process. So that's the most conventional ordering you could

1 15:44:39 2 15:44:39 3 15:44:42 4 15:44:44 5 15:44:49 6 15:44:55 7 15:44:58 8 15:45:01 9 15:45:04 10 15:45:08 11 15:45:12 12 15:45:14 13 15:45:17 14 15:45:18 15 15:45:21 16 15:45:23 17 15:45:40 18 15:45:42 19 15:45:42 20 15:45:48 21 15:45:49 15:45:50 22 23 15:46:24 24 15:46:26

25

15:46:30

have.

and if you look at the CommandTalk application and a discussion of the publications generally in the specification establish that these combinations of language processing, multimodal input, agents and facilitators had already been established as combinations in a number of prior publications and were known in the field. And the CommandTalk application in particular, again, that's Exhibit A to Sony's brief, synthesized and details all of that, so their combinations that they're trying to claim here at a very functional level was established and understood and among the most conventional ordered combinations you could come up with.

I'm happy to answer any questions the Court has.

THE COURT: No. I will hear from the other side.

MR. FENSTER: Your Honor, may I hand up a couple copies?

THE COURT: Sure.

MR. FENSTER: Is three sufficient?

THE COURT: Sure. Yes.

(Mr. Fenster handed slides to the Court.)

THE COURT: So, Mr. Fenster, before you get going, just sort of on the preliminary, in terms of claims being asserted or representative claims, could you just

36

address what your view on that is?

MR. FENSTER: Yes, Your Honor. The claim 1 of each of the asserted patents in our view is not representative of all of the claims. There are some claims that are representative of each other. We have not yet identified infringement contentions in those claims that are asserted here. I will run through for you in my presentation those claims that I believe are representative. There are a number of them.

Claim 1 is not representative of all and I will go through and explain why.

THE COURT: Okay. Good.

MR. FENSTER: Okay. First, big picture. Your Honor, 101 has gotten hard. It is not meant to be a proxy for all of the conditions of validity. It is not a proxy for obviousness. It is not a proxy for novelty, and it is not a proxy for enablement or written description. It is very narrow and specific to identify those patents that are directed to in step 1 a fundamental truth, mathematical algorithym or abstract idea.

The inquiry of step 1 is what the claims are directed to. Is their focus only the abstract idea, or is it something more?

So let's go to slide 5. These are the ineligible ideas that can't be claimed: Mathematical

1 15:48:29 2 15:48:35 3 15:48:37 4 15:48:43 5 15:48:47 6 15:48:49 7 15:48:56 8 15:49:02 9 15:49:05 10 15:49:08 11 15:49:12 12 15:49:16 13 15:49:20 14 15:49:23 15 15:49:28 16 15:49:30 17 15:49:35 18 15:49:41 19 15:49:43 20 15:49:47 21 15:49:55 15:49:59 22 23 15:50:04 24 15:50:06

25

15:50:12

algorithym, hedging, long economic practices, or like intermediating dated settlement or abstract ideas.

Is the claim focused on, directed to that? And, Your Honor, the defendants respectfully have not gone through the proper analysis.

So slide 6. The step 1 is, what is the claim directed to? In Visual Memory, there are two decisions that have come out since the briefing that I want to direct your attention to. One is Visual Memory, which reversed Your Honor's decision finding ineligible and you can contrast that with Two-Way Media, which affirmed. Drawing a distinction between looking carefully at those two opinions I think should inform your analysis here.

In Visual Memory the Court said, the first step requires Courts to determine whether the claims at issue are directed to, are they directed to, focused on one of the ineligible requirements? In DDR Holdings, the question is, is the claimed solution necessarily rooted in computer technology in order to overcome a problem specifically arising in the realm of computer networks? If it is addressed to a problem specific to computer networks or computer technology, it is not abstract.

The question for Your Honor is: Are these claims aimed at a solution to a problem specifically arising in the realm of computer technology or are they aimed at

1 15:50:16 2 15:50:19 3 15:50:25

what defendants say is the abstract idea, which you didn't hear once today, responding to the spoken word.

> Next slide, please. Slide 7.

The Federal Circuit is clear that in order for you to determine the claims to be invalid, you have to identify, defendants have the burden of identifying the abstract idea that the claims, all of them, are directed to, focused on. It's not enough that they underlie or that they may relate to or involve, but they have to be focused on, directed to the idea itself.

In their briefing, defendants identified that idea as responding to spoken requests. That is the burden that they have to show you, which you didn't hear anything about today, which is that these claims are not aimed at a solution to a problem specific to the realm of computers or technology, but rather to the idea of responding to spoken requests written large, and if so, the claims would preempt those, and they don't, as I will show you. Instead, Your Honor, I submit to you that these claims are aimed at improved technology as individual memory, improved technology for speech-based navigation of network-based electronic data sources, and to multimodal methods for resolving errors and ambiguities in doing so. specific to searching electronic databases. Responding to the spoken word has nothing to do outside of searching

1

15:52:08

electronic databases.

2 15:52:10 3 15:52:16 4 15:52:20 5 15:52:27 6 15:52:32 7 15:52:36 8 15:52:40 9 15:52:44 10 15:52:52 11 15:52:59 12 15:53:02 13 15:53:04 14 15:53:07 15 15:53:07 16 15:53:11 17 15:53:19 18 15:53:24

15:53:47

15:53:52

15:53:57

THE COURT: Well, so if in 1999 I had gone into a Blockbuster store, assuming they were still around at the time, and asked for a Clint Eastwood movie, and they had said, well, geez, there's more than one, do you want this one, do you want that one, maybe I come in. I'm speaking with an accent, so I say Clint Eastwood movie, and they think I'm talking about some other director's movie. They ask some questions. But eventually -- and maybe I speak so badly they say, well, can you write it down, because I can actually write English, though I can't speak it very well. Is not the same problem here?

MR. FENSTER: It's not, Your Honor. Slide 10, please.

So the question is what the claims are directed to, and it was long known that you can -- computers can interpret, meaning they can take the acoustic signal of a spoken word and translate that into text. Okay. That was known. It was similarly known how to search electronic databases using structured query. Defendants pointed that out in the specification. Okay. That was also known.

The problem that was specific to this realm is:

How do you use a natural language query to query a

structured database that requires a structured query?

How do you bridge the gap between asking, is it raining in

1 15:54:01 2 15:54:09 3 15:54:14 4 15:54:19 5 15:54:19 6 15:54:25 7 15:54:30 8 15:54:33 9 15:54:39 10 15:54:43 11 15:54:44 12 15:54:48 13 15:54:52 14 15:54:58 15 15:55:01 16 15:55:03 17 15:55:09 18 15:55:11 19 15:55:14 20 15:55:17 21 15:55:21 15:55:25 22 23 15:55:28 24 15:55:33

25

15:55:37

New York today and querying an electronic data source that requires only structured queries? That is exactly the technology that is claimed here, and the solution is a specific one.

It is, first, take the -- so let's focus on claim 1. One is a method of speech based navigation of an electronic data source. That is the problem. It is specific to searching electronic data sources distributed over a network located remotely from a user. That's in the claim language itself.

You receive the spoken request. You render an interpretation. Rendering an interpretation is done with conventional technology. It is translating into text and then parsing to determine in text. Okay.

There are two different technologies that the specification describes as performing that, rendering the interpretation. One is the natural language interpreter and the second is the parser, to interpret the result, to interpret the intent. Okay.

Now, those were known. What was not known is how do you then get to a structured query for a structured database? And the innovation here then comes into constructing the navigational query. And, Your Honor, the claim construction is important because the navigational query here is a structured navigational query. It is a

1 structured query specific to the type of data source being searched. It's not -- so the specification describes the

limitations of the prior art.

2 15:55:48 3 15:55:53 4 15:55:56 5 15:55:59 6 15:56:03 7 15:56:07 8 15:56:12 9 15:56:16 10 15:56:22 11 15:56:25 12 15:56:28 13 15:56:31 14

15:55:43

They said that prior voice driven systems were not sufficient because they required you to know the specific syntax of the language. What they didn't allow you to do was translate from receiving the spoken word into the structured query. You had to use the exact formulation or it didn't work. And that is what is -- that's the solution is what is claimed, described in these patents and claimed in these claims, and that is a technical solution, an improved technology. It's an improved interface for searching electronic sources.

15 15:56:40

15:56:33

15:56:42

15:56:48

15:57:06

technical solution. Can you just tell me what the claims say that technical solution is?

THE COURT: Well, so you are saying the

17 15:56:44

16

18

22

MR. FENSTER: Yes. The technical solution is

19 15:56:51

following steps. Okay. It is taking the spoken request,

claimed here in claim 1, and it is the combination of the

20 15:56:56

translating it into text, parsing it to determine intent,

21 15:57:01

structured query, and then constructing the structured query

23 15:57:12

for that data source out of the text, then soliciting

selecting the appropriate data source, determining a

24 15:57:18

additional information using a different mode of input

25 15:57:23

without requiring the user to request non-spoken modality.

1 Okay.

2

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

15:57:29

15:57:29

15:57:34

15:57:39

15:57:43

15:57:48

15:57:53

15:57:58

15:58:02

15:58:06

15:58:11

15:58:15

15:58:18

15:58:21

15:58:25

15:58:29

15:58:32

15:58:38

15:58:41

15:58:46

15:58:48

15:58:52

15:58:57

15:59:00

15:59:03

So this is happening. One, it's an iterative process. You take the written, the spoken request, you translate it, interpret it, select your database, construct a query. Then you have to solicit additional information to refine the query based on information from a different modality without the user saying, no. Show it to me as opposed to ask. And that was specifically referenced in the file history, getting to, is this preemptive? This was specifically referenced in the file history and discussed in the file history to distinguish the prior art systems that had voice driven systems, and I will show you that.

Refining the navigation query based on that system, on the additional information. This is a specific iterative process, and what the innovation that they came up with was figuring out that what we have to do is determine the intent, to select the database, figure out the structured query for that, and then construct a structured query to search the electronic database, then refine it with additional information.

That is different than the prior art. It overcame the problems that are described in Sections 1 and 2 of the '021 patent specification, and they are specifically addressed in the file history.

Your Honor, I have to apologize. We actually

cite -- we quoted from the file histories which are attached to Exhibits 1 to 3 to my declaration, but we didn't cite to them. I apologize if that caused you problems.

THE COURT: No, it didn't cause me any problems yet.

MR. FENSTER: Okay. So this is Exhibit 1. This is for the '021 patent, and the '021 patent specifically, there were two pieces of prior art that were cited. One was Levin. Levin teaches a method of using at least one natural language query to retrieve information from one or more data resources and further performing a requested action using the retrieved information. Okay. That was cited as a 102 or 103, 103 reference.

THE COURT: Okay.

MR. FENSTER: Okay. That was combined with a reference called French. And, Your Honor, this is at Exhibit 1 to my declaration at page 24. The last one was at page 23.

French teaches a management of speech and audio prompts and interface in multimodal user interfaces. And the examiner combined French with Levin to come up with an obviousness rejection. There was no 102 rejection that was cited, the specific combination of elements described in claim 1 of the '021 patent.

One of the bases for distinguishing was that

1 16:01:03 2 16:01:06 3 16:01:10 4 16:01:13 5 16:01:18 6 16:01:22 7 16:01:27 8 16:01:32 9 16:01:38 10 16:01:43 11 16:01:52 12 16:02:01 13 16:02:10 14 16:02:14 15 16:02:17 16 16:02:20

the requirement that without -- without requiring the user to request the non-spoken modality. They relied on this and the combination of elements to distinguish Levin and French. The examiner agreed, this claimed invention was different than French and Levin, which were both voice-driven systems. Okay. The point is that these are not claiming response to spoken word or preempting that field. It was specifically distinguishing prior art that claimed and described natural language queries.

In Exhibit 2 we have the '061 patent, and the '061 patent distinguished a reference called Perrone. This is Exhibit 2, and this is Exhibit 2 at page 3. Perrone teaches a method for controlling a server using a voice.

This is in the '061 patent. This is the one that has agents and facilitators, which counsel described as merely conventional, but that is what was used to distinguish the Perrone reference.

And I will take you through the '061 and why the agents, although agents were known, it's a specific architecture that is claimed in the '061 that distinguished Perrone and the other prior art and doesn't preempt the field. It is a specific type of architecture that has the facilitator with agents registering to it, which is a specific way to do it, and there are other ways to do it that are not claimed and not covered by the '061 patent.

1 16:03:03 2 16:03:06 3 16:03:12 4 16:03:21 5 16:03:38 6 16:03:44 7 16:03:50 8 16:03:54 9 16:03:58 10 16:04:05 11 16:04:08 12 16:04:14 13 16:04:26 14 16:04:34 15 16:04:38 16 16:04:43 17 16:04:49 18 16:04:53 19 16:04:56 20 16:05:01 16:05:08 21 16:05:11 22 23 16:05:15 24 16:05:21

25

16:05:25

The claim, Exhibit 3, Your Honor, goes through and is the file history for the '718 patent and further distinguishes the Levin reference that we saw earlier.

If the problem is specifically rooted in technology, it is not an abstract idea. This problem is specific to searching electronic databases. This is not how do you find the movie at Blockbuster. This is how do you query a remote electronic database using a voice-driven front end? It is specific to the technology, specific to computer technology. It only arises in that context, and because of that, the inquiry failed at step 1. They failed to meet their burden at step 1.

Okay. So we went through claim 21. Claim 1 of the '021 is representative of the independent claim 1 and the corresponding claims, independent claims of the '021 and the '718 that have the computer program method and system claims. There are three sets of claims that correspond.

Claim 1 is representative of that, and it claims the specific combination of elements. None of these elements are new, but as in Visual Media, that doesn't matter, and the reason is because we're not claiming a new -- a natural language parsing system. What we're claiming is a better improved technology for searching an electronic data source with a voice front end that has this combination of elements, converting text into a structured query after you

1 16:05:28 2 16:05:33 3 16:05:37 4 16:05:41 5 16:05:42 6 16:05:47 7 16:05:52 8 16:05:55 9 16:05:55 10 16:05:58 11 16:06:03 12 16:06:15 13 16:06:21 14 16:06:24 15 16:06:28 16 16:06:34 17 16:06:37 18 16:06:37 19 16:06:45 20 16:06:49 21 16:06:55 16:06:59 22 23 16:07:02 24 16:07:08 25 16:07:11

determine what data source to use, and then further refining in an iterative way using different modes without having to ask the user to invoke those different modes.

Next slide.

So these are claim 3 and 4, dependent claims 3 and 4. Counsel said that constructing a query doesn't mean anything because there is no teaching about how that's done.

First, that's not true. The specification specifically describes how you do that, and that is shown in Figure 5, for example, of the '021 patent. That specific method is claimed specifically in claims 3 and 4.

So this is where constructing the navigation query further includes the steps of extracting an input template for an online scripted interface to the data source and using the input template to construct the navigation query.

Claim 3 is a very specific way of accomplishing the constructing the query. It is not preemptive of responding to the spoken word. There is no way that defendants can argue that it is or that I submit Your Honor could so find. But that is what you would have to find in order to invalidate this patent large on 101.

Claim 4 is dynamically scraping the scripted interface in order to construct the query.

1 16:07:14 2 16:07:18 3 16:07:23 4 16:07:26 5 16:07:31 6 16:07:38 7 16:07:42 8 16:07:48 9 16:07:51 10 16:07:55 11 16:07:58 12 16:08:02 13 16:08:05 14 16:08:11 15 16:08:14 16 16:08:18 17 16:08:23 18 16:08:27 19 16:08:31 20 16:08:35 16:08:39 21 16:08:43 22 23 16:08:46 24 16:08:50 25 16:08:52

So claims 3 and 4 have analog. I don't agree that claim 1 is representative of 3 and 4. Three and 4 have other claims that correspond, and I would agree that 3 and 4 are representative of those.

The next slide, slide 12.

Six and 8 provide further meat on the bone.

Claim 8 is soliciting additional input is performed in response to one or more deficiencies encountered during the step of constructing the navigation query.

Your Honor, this is a specific method. It requires, first, you take the information. You translate it, parse it, identify the data source, construct a query. Then you identify deficiencies in that query and then solicit additional input using a different mode without asking the user to invoke the different mode. That's a specific iterative method that happens to work really well that these inventors, who are the inventors of Siri, I will come back to that in a moment, invented back in 1999, and that defendants, we submit, are now using. There are other ways to do it. We don't have to use this method. They're going to argue that they don't. They're going to argue that they don't infringe contrary to their general argument that these claims are preemptive of the whole field.

I want to call your attention --

THE COURT: I guess you're going to argue they

16:08:53

do infringe.

 16:08:55
 2

 16:08:57
 3

 16:08:59
 4

 16:09:02
 5

 16:09:04
 6

 16:09:09
 7

MR. FENSTER: These particular claims, yes. I'm not going to argue that there's no other way to do it or that they cover all ways to do it and therefore they infringe. We're going to show you with their source code and specific information specific to their products why they meet this limitation.

8

11

14

I wanted to call your attention to -- the next slide is 13, claims 15 through 23.

16:09:20 10

16:09:10

16:09:16

16:09:24

16:09:40

These are claims that are aimed at very specific methods of refining the query through that multimodal

16:09:30 12

solicitation of additional information. There are lots of

16:09:35 13

different ways to do it, but claims 15 through 23 provide

16:09:48 15

very specific detailed ways to accomplish that multimodal

refinement of the query, and we submit that claim 1, the

16:09:53 16

other claims, are not representative of these claims, that

16:09:56 17

these claims are representative of the corresponding claims

16:09:59 18

that have the corresponding limitations.

16:10:09 19

Claim 25 at page 14. This one is important.

16:10:16 20

Further including the step of selecting the data source from among a plurality of candidates in response to

16:10:19 21

22

25

interpretation of the spoken request. Okay.

16:10:25 23

There are lots of systems, prior art systems, that just add a front end voice driven system for accessing

16:10:31 24

a single electronic data source. One of the important

16:10:36

16:10:22

1 16:10:41 2 16:10:45 3 16:10:50 4 16:10:53 5 16:10:58 6 16:11:02 7 16:11:05 8 16:11:09 9 16:11:12 10 16:11:17 11 16:11:23 12 16:11:28 13 16:11:32 14 16:11:35 15 16:11:40 16 16:11:46 17 16:11:51 18 16:11:56 19 16:11:59

20

21

22

23

24

25

16:12:02

16:12:05

16:12:12

16:12:17

16:12:20

16:12:26

improvements of this technology was the ability to take the interpretation and use it to select the appropriate data source out of a plurality of data sources. Are you asking about the weather or are you asking about the score of last night's baseball game or was it basketball, or are you asking about the train schedule? Those all require searching different data sources. One of the important things that this technology, that this improvement accomplished was the ability to discern from the interpretation what data source should I use, because that drives what structure query I need to construct, what the system needs to construct automatically based on the interpretation before refining it with additional information.

Claim 72 is analogous to claim 1 except that it specifically requires natural language spoken request.

Claim 1 is spoken request. Part of, and claim 72 is corresponding, but it's limited to natural language as opposed to a spoken request.

Your Honor, I won't go through the '718. Let me just point to, take you to the '061 patent. So this is slide 19.

So, remember, your overarching inquiry is, is this aimed at, directed to, does it claim all methods of responding to a specific request, or is it more specific?

1 16:12:30 2 16:12:34 3 16:12:35 4 16:12:38 5 16:12:43 6 16:12:47 7 16:12:52 8 16:12:55 9 16:13:01 10 16:13:04 11 16:13:09 12 16:13:14 13 16:13:19 14 16:13:23 15 16:13:32 16 16:13:36 17 16:13:42 18 16:13:49 19 16:13:54 20 16:14:00 16:14:01 21 16:14:03 22 23 16:14:07 24 16:14:11

25

16:14:15

Is it claiming a specific technical solution to a technical problem rooted in technology?

So this is utilizing agents for speech-based navigation of an electronic data source. You have rendering the interpretation, constructing a navigation query.

Everything I said about the claim 21 applies to that.

Routing the navigation query to at least one agent. Okay. This is important because this implies an architecture where you have multiple agents and you route the query to one of several agents, and when you get to "E," it requires a facilitator that manages data flow among multiple agents and maintains a registration of each agent's capability.

So this is shown in Figure 6. This is the facilitator. The facilitator has lots of agents that are registered with it. It has to maintain a registration of the agents registered with it and their capability. So when the interpretation renders a request for weather, or a web search or an e-mail or something else, the facilitator knows how to do that.

Now, why is that important and how does this distinguish over prior art? Because this is a distributed architecture as opposed to a flat architecture. And in the file history, they distinguished French, which was a flat architecture. Some of the prior art that we'll hear about

1 16:14:19 2 16:14:25 3 16:14:29 4 16:14:32 5 16:14:38 6 16:14:43 7 16:14:47 8 16:14:52 9 16:14:59 10 16:15:03 11 16:15:05 12 16:15:09 13 16:15:14 14 16:15:14 15 16:15:17 16 16:15:24 17 16:15:29 18 16:15:32 19 16:15:33 20 16:15:35 21 16:15:40

16:15:48

16:15:51

16:15:55

16:16:03

22

23

24

25

in this case as it goes forward is prior art that had serial -- it didn't route to a particular agent. It just serially searches different databases until it comes up with a result. This claim requires an architecture that is improved over that, because it allows the routing of the query to the appropriate agent, the appropriate database based on the interpretation, and it does that because it's able to consult its registration of the agents and their capabilities in doing so, and that is a claim limitation specific to the claim, that it's in the architecture, and that is different than responding to a spoken request. It is specific, it's a specific solution to a specific technical problem.

THE COURT: So you used the word or phrase, distributed architecture. Is the concept here that the facilitator gets some kind of communication and then it has all of these choices that it picks one according to some rule or something?

MR. FENSTER: That is essentially right. So if we go back to the claim, the claim has routing the navigation query to an agent, invoking a user agent for outputting the selected portion of the electronic data source to the user, wherein a facilitator manages data flow among multiple agents and maintains a registration of agents' capabilities. So that is right and that is what is

1 16:16:07 2 16:16:10 3 16:16:15 4 16:16:16 5 16:16:20 6 16:16:25 7 16:16:30 8 16:16:30 9 16:16:32 10 16:16:37 11 16:16:40 12 16:16:46 13 16:16:49 14 16:16:53 15 16:16:57 16 16:17:02 17 16:17:12 18 16:17:17 19 16:17:20 20 16:17:23 21 16:17:27 16:17:31 22 23 16:17:36 24 16:17:37

25

16:17:40

reflected in the claim, as was shown in Figure 5 and described in the specification as an improved technology.

And --

THE COURT: And so you said as opposed to a flat architecture. Is that something where it just -- there's no kind of intelligent choice. You just go through by brute force?

That's right, Your Honor. MR. FENSTER: you'll hear in this case when we go through the development of the technology that led to these patents, the inventors of Siri went through a long development that led to these patents and part of that development was figuring out how do you construct the query. Part of that development was figuring out this architecture that is claimed and reflected in the '061 patent, because prior to this there was prior art that could take a spoken request and search multiple data sources, but it had no intelligence, no facilitator that had a registration of the capabilities in order to So it would just serially search. It searches choose. database 1, do I have an answer? No. Let's go to source 2, source 3, et cetera, and it didn't have the feedback system that is described in claim 4 of the '061 and others as well.

But this architecture was an important point, and it's part of the history of the development that led to

the inventions that are claimed in these patents in 1999.

Counsel for Sony argued that, in connection with the '061, none of this was new, that all of this was old, that this combination of elements was conventional.

First, that's not the right inquiry at the 101 stage.

Second, that is entirely lawyer argument unsupported by any evidence that it's inappropriate at the 12(b)(6) stage where you have to find that there's no set of facts under which plaintiff can prevail, under which these claims could be eligible under 101. That's just not sufficient to meet their burden under -- to prove these patents invalid under 101.

What you heard is a lot of argument that each of the elements in isolation were in the prior art. What you didn't hear or see is any evidence that shows that the combination of elements, that the combination of figuring out the structured query and then a multimodal iterative process to improve that query to get the information, that that combination of elements that are reflected in the claim was conventional. And, more importantly, they are aimed at an improved technology that is specific to a -- that is aimed at a problem that is specific to computer technology. There is just no way around that, and that is step 1. That is your analysis of step 1.

1 16:17:45 2 16:18:07 3 16:18:13 4 16:18:18 5 16:18:22 6 16:18:27 7 16:18:27 8 16:18:29 9 16:18:37 10 16:18:39 11 16:18:41 12 16:18:47 13 16:18:50 14 16:18:53 15 16:19:03 16 16:19:10 17 16:19:14

18

19

20

21

22

23

24

25

16:19:19

16:19:24

16:19:30

16:19:33

16:19:38

16:19:43

16:19:46

16:19:50

1 16:19:54 2 16:20:01 3 16:20:06 4 16:20:10 5 16:20:14 6 16:20:17 7 16:20:20 8 16:20:27 9 16:20:32 10 16:20:36 11 16:20:41 12 16:20:44 13 16:20:50 14 16:20:55 15 16:20:59 16 16:21:14 17 16:21:20 18 16:21:25 19 16:21:28 20 16:21:30 21 16:21:33 16:21:40 22 23 16:21:45 24 16:21:46 25 16:22:08

Your Honor, I do want to commend you to go back to the Visual Memory case, the Visual Memory case, and compare that to Two-Way Media. The Visual Memory case is dispositive in this case and these claims are analogous, and for the same reasons that the Federal Circuit found, contrary to your initial determination, that the claims were directed to an abstract idea in Visual Memory, these claims are not aimed at, focused on, directed to, limited to the abstract idea of responding to a spoken request. They're just not. They are recited to and aimed at a specific combination of elements that solves a problem that is absolutely specifically and only rooted in technology.

THE COURT: So a lot of the prior cases have analogies of things like libraries, and so one of the things that I'm trying to think about is that a lot -- it seems like some of the prior cases at least involve putting things on computers and networks and that sort of thing.

MR. FENSTER: Yes.

THE COURT: And so I'm trying to figure out what the difference is between one that is rooted in computer technology and one that is essentially a generic problem, if you will, that you can have also on a computer.

MR. FENSTER: Yes.

THE COURT: And, in any event, so part of the issue, or maybe not part of the issue, but one of the things

16:22:11	1
16:22:16	2
16:22:22	3
16:22:27	4
16:22:36	5
16:22:45	6
16:22:52	7
16:22:52	8
16:23:00	9
16:23:01	10
16:23:08	11
16:23:12	12
16:23:16	13
16:23:19	14
16:23:22	15
16:23:27	16
16:23:31	17
16:23:37	18
16:23:42	19
16:23:46	20
16:23:50	21
16:23:54	22
16:23:55	23
16:23:56	24
16:24:00	25

then is that, to some extent, I think in some of these other cases, the Court, the Federal Circuit has been influenced by the fact that the description in the claims of the method or the system or whatever it might be is generic, and so one of the things particularly in the independent claims here is it seems awful generic. And what's your response to that?

MR. FENSTER: All right. So let me -- there are two parts to that.

So the first is, when is the analogy to a library or something else, something that you can do in the human mind, when are those appropriate as opposed to when is it specific to a computer technology?

THE COURT: Right. And in particular, and I forget whether it's Bascom or Enfish, the self-referential table, that had no possible analogy of something that existed -- I mean, that only existed in a computer.

MR. FENSTER: Well, so I agree that is what the -- I agree with your last statement, but I don't agree that there couldn't have been other analogies, and I'm sure the defendants in that case argued that this is just like a library --

THE COURT: Maybe they did.

MR. FENSTER: -- card that has, that self-refers to something else. So we've been doing this for years, and

1 16:24:04 2 16:24:08 3 16:24:14 4 16:24:17 5 16:24:21 6 16:24:24 7 16:24:29 8 16:24:35 9 16:24:40 10 16:24:49 11 16:24:51 12 16:24:54 13 16:25:01 14 16:25:05 15 16:25:08 16 16:25:12 17 16:25:16 18 16:25:18 19 16:25:22 20 16:25:26

16:25:30

16:25:38

16:25:43

16:25:48

16:25:52

21

22

23

24

25

the Federal Circuit said, no. This is specific to computer technology and what it is is an improved database. Even though there may be analogies in the real world, that's not what the claim is about. The claims in that case were about an improved technology, an improved database. In this case, it's about an improved method for searching electronic data source using a speech, a speech-driven system that has a multimodal feedback for refining that. That is to be distinguished from cases like Bilski. Okay. So this was the Hedging case.

So a lot of the cases that I think Your Honor's first question went to are claims that invoked a computer, but it wasn't improving the computer itself. Right. So it's doing something that people have been doing forever, but doing it faster because you use a computer. Invalid. Abstract. Right. But there wasn't an improvement in the computer itself or in the functioning of the computer or how it did that. It was just saying, use a computer to do something that we've always done, and that, the Federal Circuit has held, the Supreme Court has held, is abstract. That is to be distinguished from DDR, Enfish, Amdocs, Visual Memory, Fales. Okay. All of these cases that say, that found that the problem was specific to the technology itself. And here, it's not -- this isn't addressed to the problem of, if you ask me a question as a person in my human

1 16:25:56 2 16:26:02 3 16:26:06 4 16:26:11 5 16:26:16 6 16:26:19 7 16:26:23 8 16:26:29 9 16:26:34 10 16:26:39 11 16:26:46 12 16:26:49 13 16:27:00 14 16:27:04 15 16:27:09 16 16:27:16 17 16:27:21 18 16:27:26 19 16:27:27 20 16:27:28 21 16:27:34 16:27:39 22 23 16:27:43 24 16:27:44

25

16:27:51

mind, how do I respond to that, and it's not saying just do it with a computer. This is specific to the problem of, how do you search a structured electronic database by asking it a natural language question? Well, you need a front end system to do that, and the front end system takes the language, converts it to text, parses it, selects the database, finds a structured query form, populates that structured query form, queries the database, and then refines it using other modes to do that, and it's that combination that was the winning combination back in 1999 that was the solution to that problem.

So this is a difficult question, and I don't know how to articulate it better than I have, and I'm sorry, but what I can refer Your Honor to is compare Bilski and Alice and that line of cases with Enfish. Enfish has a great discussion on this. DDR was probably the first case by the Federal Circuit to describe a technologically based problem.

THE COURT: Yes. That's for sure.

MR. FENSTER: Visual Memory has a very good, very recent discussion on exactly this problem. And I will also refer Your Honor to Amdocs. That has a good discussion that's relevant to our case.

This problem is claimed, it's described in the specification as specific to electronic database. It is

1 16:27:56 2 16:28:03 3 16:28:08 4 16:28:14 5 16:28:17 6 16:28:24 7 16:28:25 8 16:28:30 9 16:28:34 10 16:28:38 11 16:28:46 12 16:28:52 13 16:28:59 14 16:29:03 15 16:29:09 16 16:29:13 17 16:29:17 18 16:29:21 19 16:29:26 20 16:29:29 21 16:29:34 16:29:40 22 23 16:29:49 24 16:29:52

25

16:29:54

only because it's a structured electronics data source that can only be queried in a structured query. That's the problem. And it's, how do you interpret a natural language, spoken request to do that? That is the technological problem rooted in that technology that is addressed by these patents and claimed.

Now, to your second question, isn't this a generic way to do it? They seem kind of generic.

Can we go back to claim 1 of the '021.

So, Your Honor, it is not. So there were prior art systems that had natural language front ends or had spoken word front ends, but they didn't have this combination that allowed it to effectively do what this invention does, and it's this combination of steps of converting it to text, parsing it for intent, selecting the data source, which gets you to a structured query.

Constructing the query under the construction that is set forth in the specification itself is important, because it's not any query. It is a structured query specific to that database that selects that data source.

THE COURT: Well, maybe the question to ask is:

So how does a structured query distinguish from just a

query?

MR. FENSTER: So a structured query is defined in the specification and in our proposed claim construction

1 16:29:57 2 16:30:02 3 16:30:07 4 16:30:08 5 16:30:11 6 16:30:12 7 16:30:18 8 16:30:22 9 16:30:29 10 16:30:34 11 16:30:38 12 16:30:42 13 16:30:46 14 16:30:51 15 16:30:56 16 16:31:02 17 16:31:05 18 16:31:09 19 16:31:14 20 16:31:19 21 16:31:23 16:31:27 22 23 16:31:32 24 16:31:36

25

16:31:42

that corresponds directly as the structured query that is appropriate for that data source. Different data sources have different structures.

THE COURT: So the structured query is really the right query?

MR. FENSTER: No. It is the structured query that is dictated by the selected data source. Okay. So if it's an SQL database, it may be an SQL query and it is flexible in its approach, meaning it allows for the selection of different data sources and the possibility that different data sources may have different structures of queries necessary, different forms, templates that have to be populated to use, to query that data source, and the specification describes that that is something that is dictated by the data source itself. But what is required is to bridge the gap between the spoken language and the data source is selecting the data source, recognizing that it has a specific type of structure that you need to use, populating that, and then it provides a mechanism to recognize deficiencies in that query and how to resolve that, and it provides very specific methods using multimodal technologies and those methods described in claims 15 to 23 of the '021 patent to resolve those ambiguities.

It's a specific way to do it. It may be broad, but it is not preemptive, and if it is so broad as

16:31:47	1
16:31:50	2
16:31:55	3
16:32:00	4
16:32:02	5
16:32:04	6
16:32:07	7
16:32:08	8
16:32:10	9
16:32:14	10
16:32:15	11
16:32:16	12
16:32:27	13
16:32:33	14
16:32:35	15
16:32:40	16
16:32:44	17
16:32:49	18
16:32:52	19
16:32:52	20
16:32:54	21
16:32:55	22
16:32:56	23
16:33:00	24
16:33:06	25

defendants say, then they'll have lots of prior art and be able to prove that it's invalid under 102 or 103. But 101 is not a proxy for that analysis. These cases should go forward. They have not met their burden under step 1 or step 2 of the 101 analysis.

THE COURT: All right. Thank you, Mr. Fenster.

MR. FENSTER: Thank you, Your Honor.

THE COURT: All right. Not too much, but I assume there's probably a desire to reply to some of this?

MR. HADDEN: If I could, Your Honor?

THE COURT: Sure.

MR. HADDEN: So I'm pulling up this slide. Let me respond briefly to Your Honor's question and a sort of general description of the 101 law, because I think there are actually sort of two paths to 101. There's clearly the Bilski line of cases, Amazon OIP, where the issue is just, are you taking a standard brick and mortar business practice and putting go it online. Those cases are clearly invalid.

THE COURT: Yes. We're not talking business practice here.

MR. HADDEN: We're not talking that. There's another line of cases though, and it goes back to our first quote. Two-Way Media, which is, there are also cases that are abstract because they're claiming a result and not a

1 16:33:11 2 16:33:18 3 16:33:20 4 16:33:24 5 16:33:26 6 16:33:32 7 16:33:36 8 16:33:40 9 16:33:43 10 16:33:48 11 16:33:51 12 16:33:56 13 16:33:59 14 16:34:00 15 16:34:08 16 16:34:15 17 16:34:18 18 16:34:20 19 16:34:25 20 16:34:30 21 16:34:36 16:34:39 22 23 16:34:45 24

16:34:45

16:34:48

25

specific solution. That's Affinity Labs, Two-Way Media, TLI, all of those cases.

Now, there is not a get out free card from 101 because your claims are about digital information or computers. Right. Two-Way Media was about a network, multicasting, streaming system. It was rooted in computer technology. But the Federal Circuit found it was invalid because it wasn't claiming a specific solution. It was claiming a result. The same thing in Affinity Labs. Right. It was about streaming digital information to a handheld device. That is rooted in computer technology. It's still invalid because it didn't claim a specific way to do it. claimed a result.

THE COURT: So claiming a result of a 101 problem, when you claim a result, what does the Court say you should say of the abstract idea?

The abstract idea is the result. MR. FENSTER: Right. Here it is responding to a spoken request. All In TLI, it was providing information to a portable right. device. Not TLI. Sorry, Your Honor. Affinity Labs. TLI, I forgot the exact articulation, but it was basically the ability to upload and categorize digital images on a server. Right.

All of those things are rooted in technology and computers, but they're not providing an improvement to

1 16:34:53 2 16:34:56 3 16:35:00 4 16:35:02 5 16:35:05 6 16:35:08 7 16:35:14 8 16:35:18 9 16:35:23 10 16:35:27 11 16:35:30 12 16:35:33 13 16:35:37 14 16:35:40 15 16:35:44 16 16:35:48 17 16:35:55 18 16:35:59 19 16:36:04 20 16:36:14 16:36:17 21 16:36:19 22 23 16:36:24

24

25

16:36:27

16:36:30

computer technology. They're just claiming a result that is obtained using computers or networks or other things, and that's what's happening here.

The other kind of issue that we heard for the first time really, which was not in their brief, was what was that the specific technical solution here is taking a query that is formulated in a natural language and converting it to a structured query. But there is nothing in this claim that provides a solution for doing that.

So if we look at the slide we have up, as Your Honor pointed out, right, a navigation query under their construction is a query that works. There's nothing that tells you how to construct that query that will work.

There's nothing in this claim that tells you how to select the appropriate database for which you will then construct the appropriate query. It just said creating, using.

Right. Saying, do the right thing to get the information the user wants with no method or algorithym or steps or solution for figuring out how that is and how to do it.

And we go back to the Clint Eastwood example and Your Honor's video store. There's no distinction. Right.

The same steps in this claim could be performed with the clerk at the video store, and there's no more detail in this claim as to how a computer can solve the problems that are required. For example, identifying what the specific

1 16:36:34 2 16:36:37 3 16:36:42 4 16:36:45 5 16:36:49 6 16:36:50 7 16:36:53 8 16:36:56 9 16:37:01 10 16:37:04 11 16:37:10 12 16:37:13 13 16:37:18 14 16:37:21 15 16:37:25 16 16:37:27 17 16:37:31 18 16:37:34 19 16:37:36 20 16:37:40 21 16:37:44 16:37:46 22 23 16:37:46 24 16:37:48 25

16:37:49

database is, identifying what the format of a structured query would need to look like for that database. creating that structured query from the meaning of the words that were obtained from the user. None of that is described in this claim.

In addition, soliciting the additional input, there's no description on how the system determines additional input is needed, how that additional input could be used in this structured query that has to be created, or anything else. Right. All this claim does is our Clint Eastwood walk through. Right. I want this. Here are some Pick one. You get what you want. That's why this options. claim is abstract. It claims nothing but the idea for that interaction. It leaves it to someone else to figure out all the hard stuff, like, what is the right structured query, what is the right database, how would you find it, how would you do this magic conversion from natural language to a structured query? It's just not there.

THE COURT: So the claim, one of these dependent claims Mr. Fenster showed, it talks about --

> MR. HADDEN: Creating a template or something? THE COURT: Yes.

MR. HADDEN: First off, Your Honor, none of that was raised in their brief.

THE COURT: Well, yes, I didn't see it in the

1 16:37:53 2 16:37:57 3 16:38:02 4 16:38:11 5 16:38:12 6 16:38:22 7 16:38:30 8 16:38:35 9 16:38:38 10 16:38:42 11 16:38:43 12 16:38:46 13 16:38:48 14 16:38:49 15 16:38:53 16 16:38:56 17 16:39:01 18 16:39:05 19 16:39:07 20 16:39:11 21 16:39:14 16:39:20 22 23 16:39:25 24 16:39:26

25

16:39:30

brief either, but that's part of the reason why we have argument, to flesh out or you talk about a smoke out. You know, what everybody's positions are. I'm sure you have a response.

To the extent the -- I was just going to say, it may be that if the briefing is all about claim 1, maybe we'll address claim 1, but if it goes badly for the plaintiff, then we'll have another round where we address claim 3 and 4. I mean --

MR. HADDEN: We can do that. Those claims weren't asserted. They were never raised in the brief. I can respond off the cuff, but I'm not sure it's going to be complete.

But to follow up what's on the screen, it says, basically, you find some template that works and you adapt it based on the natural, the meaning of what was said. That again is not solution. It doesn't tell you how to find the template. It doesn't tell you what the template is. It doesn't tell you how you go from the meaning of the words that were spoken to some structure that would be appropriate for a particular database. It adds maybe a little gloss, but it says nothing about how you would actually do this and whether it would be a solution.

But if they're going to hang their hat on claim 3 or 4, we're happy to address it, but those aren't asserted

16:39:35	1	and have nothing to do with the case.
16:39:37	2	THE COURT: You say they aren't asserted, but I
16:39:40	3	thought I heard Mr. Fenster say they had the claims to
16:39:42	4	assert it.
16:39:43	5	MR. HADDEN: They identified claims in their
16:39:44	6	complaint.
16:39:45	7	THE COURT: Oh.
16:39:45	8	MR. HADDEN: And we addressed those claims.
16:39:47	9	THE COURT: Okay. But that does not really
16:39:50	10	limit them.
16:39:51	11	MR. HADDEN: Understood, Your Honor. I saw no
16:39:53	12	there, there. If you would like me to address it's in more
16:39:56	13	detail, I'm happy to do it.
16:39:58	14	THE COURT: All right. It wouldn't be the first
16:39:59	15	thing that we're going to do here.
16:40:01	16	Okay. Do you have anything else, Mr. Hadden?
16:40:03	17	MR. HADDEN: Unless Your Honor has questions, I
16:40:05	18	will give my colleague a shot.
16:40:06	19	THE COURT: No. I will give your colleague a
16:40:08	20	shot, too.
16:40:09	21	MR. HENDERSHOT: I appreciate it, Your Honor.
16:40:13	22	Bring up slide 12.
16:40:18	23	So with respect to the structured query that
16:40:24	24	they talked about, they talked about using conventional
16:40:26	25	technology, conventional technology. They talk about,

1

really, it's about the structured query.

2 16:40:34

16:40:29

16:40:36

16:40:51

16:40:54

16:40:56

21 16:41:33

16:41:35 22

23 16:41:38

24 16:41:41

25 16:41:45

These are their constructions of a navigation And if you look at the specification, the second quote, it says, practitioners of ordinary skill in the art

navigation through structured query. So they're familiar

will be thoroughly familiar with the notion of database

with that, which I believe he conceded, but not just the

idea that you can do it.

It continues and says, those practitioners will be readily able to appreciate and utilize the existing data structures and navigational mechanisms for a given database, and this is the key point, the last bit. Or to create such structures and mechanisms where desired.

So it is fully within those of skill in the art to create the structured query. I'm not arguing 102 or 103 This is the specification, which is properly in right now. the record under a Rule 12 motion, copying what he just said the invention as conventional. That's their own That's not attorney argument. That's not me specification. trying to characterize some things. That is their specification. And they said what he said the invention is was conventional and something of a person of ordinary skill in the art was readily able to implement.

With respect to claims 3 and 4 and scraping a template, again, those were not in the brief, but I would

1 16:41:48 2 16:41:54 3 16:41:58 4 16:42:02 5 16:42:07 6 16:42:09 7 16:42:12 8 16:42:15 9 16:42:16 10 16:42:19 11 16:42:23

point the Court's attention to in the '061 patent, column 9. I will begin reading from line 36. It says, in many existing Internet and Intranet applications, an online data source is accessible to users only through the medium of an interaction with so-called common gateway interface script, or a CGI script, which is what he was talking about scraping. That was ubiquitous technology in the Internet then and now.

The patent continues to discuss this CGI script, which was ubiquitous and acknowledged in the patent as standard.

In column 10, beginning at line 6, in the embodiment just described, scraping step, which is scraping that template, is preferably carried out with the assistance of an online extraction utility, such as WebL. That's capital W-e-b-L.

And it says WebL is a scripting language and continues on, describing its capabilities, and the complete source code for WebL is available from Compaq. This is off-the-shelf software that they are talking about using. It was ubiquitous at the time. The specification or the points he's talking about in these claims at a minimum are talking about using purely conventional and off-the-shelf software. That's not me arguing that. That's the language of the specification.

16:43:14	1
16:43:19	2
16:43:25	3
16:43:29	4
16:43:32	5

16:44:32	23
16:44:33	24
16:44:34	25

There was some discussion of 101 not being a proxy for 102 or 112. I agree. I'm not arguing 102 or 13. I think they will have 112 problems down the pike if we get there. But we focused on the claims and admissions in the specification demonstrating they are conventional.

The addition of computing technology that is conventional, as admitted in the specification, doesn't transmit a claim in Alice step 2. That's why we focused on that. I'm not arguing 102 or 103 here, but counsel laid out file histories and argued 102 and 103 in connection with the file histories to argue that these claims aren't preemptive because they distinguished over prior art.

When these patents were prosecuted, State Street
Bank was the law of the land. You could patent anything
under the sun made by man. So it was years before Bilski,
years before Alice.

THE COURT: I didn't think he was doing that to say there had already been some kind of ruling on 101.

MR. HENDERSHOT: Yes. I would say the law is developed since then and the fact that they overcame a 102 or 103 objection I don't think is relevant to 101.

In Two-Way Media, Federal Circuit recently stated --

THE COURT: I know what they said.

MR. HENDERSHOT: All right. And they also said

16:44:36 1

16:44:39

16:44:41

16:44:42

complete preemption is not required, I'm sure Your Honor is familiar with, and the Cramps analysis, Alice Step 1 and Step 2, which we've addressed.

And just to circle back briefly, these claims involve computers. There's no question they recite conventional generic computing technology. But Your Honor is talking about a brick and mortar example of a library, and we laid out a couple of those examples in our briefing.

THE COURT: Yes. I can't remember. I read so many of these briefs, there are so many analogies, and people like to use the same analogies, so I get them all confused.

MR. HENDERSHOT: I did a law firm's files because it's near and dear to my heart, but I can go with the library you talked about.

If I go to a librarian and I want to find a

Law Review article from, say, Judge Learned Hand wrote one.

I can't name one off the top of my head. I apologize. I

will ask for help in the library because I'm not going to be

able to find that myself, make an oral request. Hey, I'm

looking for a Law Review article by Judge Hand. The

librarian is going to render an interpretation of that. If

that's not enough information, she's going to ask me for

more. Maybe there's a form that I need to fill out. Maybe

multiple forms. Maybe one for microfiche. Maybe one for

1 16:45:53 2 16:45:55 3 16:45:58 4 16:45:59 5 16:46:01 6 16:46:05 7 16:46:09 8 16:46:12 16:46:17 9 10 16:46:20 11 16:46:22 12 16:46:27 13 16:46:32 14 16:46:34 15 16:46:37 16 16:46:40 17 16:46:47 18 16:46:51 19 16:46:54 20 16:46:58 16:47:03 21 16:47:06 22 23 16:47:09

just getting a book off the shelves, a research request.

Those are structured queries at the level they're talking about.

And all of the claims, all of the elements in these claims map to that kind of example. If I have to do a non-spoken modality and fill out, this is the title of the article, or this is where I think it was published, that is an interaction that maps to these claims. And I say that not because this is a business method that was done off the Internet that they're trying to put on the Internet. I'm not invoking that line of cases, but what it's illustrative of is that they are claiming these desired results at such a high functional level that's fundamental to processing the spoken request, they still map to brick and mortar examples as we laid out in our briefing.

So it is the fact these claims are claiming things in results oriented language, desired functions they want to achieve, I don't have a specific way of getting them done. That's why I'm asking for a brick and mortar example, and those, each of those steps in those functions are fundamental to the abstract idea identified in the briefing, which was responding to a spoken request for information.

We've laid that out in our briefing. I won't burden you with more argument now on it. That covers what I have.

THE COURT: All right. Mr. Fenster, I detect

1 16:47:22 2 16:47:23 3 16:47:26 4 16:47:35 5 16:47:37 6 16:47:39 7 16:47:39 8 16:47:44 9 16:47:47 10 16:47:51 11 16:47:54 12 16:47:59 13 16:48:03 14 16:48:04 15 16:48:07 16 16:48:14 17 16:48:19 18 16:48:23 19 16:48:28 20 16:48:34 21 16:48:39 16:48:42 22 23 16:48:46

that you would like to respond.

MR. FENSTER: Your Honor, I will keep it very brief. Two-Way Media and Visual Memory. I commend you to read these two decisions.

THE COURT: Right. You said that at least once already.

MR. FENSTER: So in response to what Mr. Hadden just said. So the difference is in Visual Memory, there was an improved technology, and in Two-Way Media, there was no improvement in technology. It did involve streaming, but it didn't involve any technology, an improvement in technology, and that was the difference between Two-Way Media and Visual Memory.

Here, there is an improved technology, and that is the ordered combination. This combination of elements is not old or conventional, and neither of the defendants can point to anything in the specification that says, this ordered combination is old. It's conventional. Instead, they point to individual elements in isolation. That goes to enablement, not to the overall concept and whether these were put together in an unconventional way, and if they were so conventional, then they will have 102 art for Your Honor, and they don't.

THE COURT: The argument I think Mr. Hadden made, I'm not sure I actually heard made quite the same way

16:48:57	1	before, which I think I should fairly summarize as being,
16:49:09	2	patents are abstract when they just claim the results. What
16:49:13	3	about that?
16:49:14	4	MR. FENSTER: These don't claim the result.
16:49:17	5	They claim a series of steps to get there, and that
16:49:23	6	argument, that very argument is specifically addressed at
16:49:25	7	pages 12 to 15 of the Visual Memory case. And, Your Honor,
16:49:34	8	they go through and say that analysis is wrong at the 101
16:49:38	9	level. It goes to enablement. Read pages 12 to 15 of the
16:49:44	10	Visual Memory case in light of Mr. Hadden's argument. It
16:49:47	11	addresses exactly that.
16:49:49	12	THE COURT: Okay. Thank you.
16:49:51	13	MR. FENSTER: Thank you, Your Honor.
16:49:52	14	THE COURT: All right. I will take this under
16:50:00	15	advisement and in due course will issue some opinion.
16:50:17	16	And is there anything further that I can help
16:50:19	17	you with today?
16:50:20	18	MR. FENSTER: No, Your Honor.
16:50:20	19	MR. HADDEN: No, Your Honor.
16:50:22	20	MR. HENDERSHOT: No, Your Honor.
16:50:22	21	THE COURT: All right. Well, thank you very
16:50:24	22	much for your time. We'll be in recess.
16:50:35	23	(Hearing concluded at 5:00 p.m.)
16:50:35	24
